Name of the Guide		G. Lavanya

Abstract

EvenConnect is a smart event management and registration system designed to simplify the process of discovering, organizing, booking, and managing events. The system provides a centralized platform where users can register, log in, search for events, view event details, book tickets, make payments, manage bookings, and receive booking confirmations.

The system supports different actors with different responsibilities. Users can participate in events and manage their bookings, Organizers can create and manage events and generate attendee and revenue reports, while Administrators can monitor payment-related information and manage refunds. The system is divided into four major modules: User Management, Event Management, Ticket Booking, and Payments & Reports.

The project follows the Agile development process, using an iterative sprint-based approach to develop, test, review, and improve the system. Java is the preferred programming language, with MySQL used for database management and JDBC for database connectivity. The proposed system aims to provide an organized and efficient platform for event registration, ticket booking, payment processing, and event-related operations.

The system is intended to reduce the difficulties associated with managing event-related activities by bringing major operations into a single platform. It provides an organized way to handle user accounts, event information, ticket bookings, payments, reports, and refunds, while allowing each actor to perform their respective responsibilities efficiently.
