3	2420030556	Sri Hansika Saraf
4	2420030558	Bobbadhi Kundana Mani
Name of the Guide		G. Lavanya

Abstract

EventConnect is a web-based Event Registration and Booking System designed to simplify the process of discovering, organizing, booking, and managing events through a centralized digital platform. Traditional event management often involves manual registration, inefficient communication, and difficulty in tracking bookings and payments. EventConnect addresses these challenges by providing a single platform that connects users, organizers, and administrators.

The system enables users to register and log in, search and view event details, book and cancel tickets, make online payments, view booking history, and download tickets. Organizers can create, update, and delete events, manage bookings, view attendee information, and generate attendee and revenue reports. Administrators can monitor payment information and manage refund-related activities. The system is divided into four major modules: User Management, Event Management, Ticket Booking, and Payments & Reports.

The project follows the Agile Scrum development approach, using incremental development, sprint planning, continuous testing, regular feedback, and improvement after each sprint. Jira is used for project management, task assignment, and sprint tracking, while GitHub is used for version control and team collaboration. The technology stack includes HTML, CSS, JavaScript, Java, MySQL, and JDBC, with Postman used for API testing.

Docker is used for application containerization, providing a consistent environment for development and deployment, while Kubernetes is used for container orchestration and management. Overall, EventConnect aims to provide an efficient, organized, and user-friendly platform that reduces manual effort and integrates event discovery, registration, ticket booking, payments, reporting, and refund operations into one centralized system.
